

After reviewing technical evidence provided me it appears evident that the current standards regarding providing Internet connections over power lines, known as BPL and PLC, endangers the use of the HF radio spectrum by radio services already existing.

I challenge the FCC to come up with higher standards for the use of BPL / PLC so that these bands are no longer interfered-with by electric utilities using their infrastructure for digital communications. I am a radio amateur, former broadcaster, and currently a network administrator, and it's really sad to see the FCC allow compromise that harms the radio bands as it has in a variety of ways in the past few years... all in persuit of money.
